

ACITEST UNIPRO

THE PRODUCT

Non contractual picture

Acitest UniPro, developed by Climalife, gives you within seconds the acidity level for each type of oil used in cooling systems (mineral, alkylbenzene, polyol ester, poly alpha olefin oils).

The immediate diagnosis of **Acitest UniPro** reduces the risk of potential breakdowns, and improves the safety and productivity of your installation. Faults caused by the oil acidity are a risk factor for cooling systems.

Acitest UniPro comes ready to use in a bottle with large aperture, making the filling procedure fast and efficient.

APPLICATION

Open the bottle and fill with oil to the top of the label. Close the bottle and shake for 5 to 10 seconds. Let stand for 15 seconds.

The colour obtained indicates the condition of the oil:

- If the mixture stays **blue**: the acidity of the oil does not present any concerns.
- If the mixture turns **green**: the oil acidity has reached its safe limit. A simple correction is necessary: usually an oil change and replacing the filter/drier.
- If the mixture turns **yellow**: the oil acidity is in a dangerous condition. A more extensive intervention is necessary involving cleaning of the circuit, before an oil change and replacement of the filter/drier.

Colour of the mixture Acitest UniPro / Oil

Note : The colours in the graph may not be as pronounced, depending on the nature of the additive, the wear and tear and the colour of the oil sample.
