

WEBINAR SUMMARY

Key Takeaways from the UK Refrigerants Webinar 23 February 2021

- 1 From 1st Jan there has been a further 29% cut in available quota which takes us to a total 45% reduction in quota from the 2015 baseline.
- 2 In under 3 years time we will see a further 31% reduction. We have the products already to allow for these quota reductions but we absolutely need to move faster in adopting use of the new products to move away from high GWP refrigerants.
- 3 UK Quota legislation may prove to be a challenge if we do not accelerate the transition to lower GWP Refrigerants.
- 4 Encourage end users to get on and retrofit systems that can be easily changed to lower GWP refrigerants, don't wait until you cannot get re-processed refrigerant and subsequently have unplanned down time.
- 5 There is no one solution for all applications. Choose the right refrigerant for your application and requirement. EN 378 and other standards will help you with risk assessment.
- 6 Engineers need good training to work on all applications and they need the right equipment to work to best practices and use the principles of refrigeration.
- 7 Keep planning ahead for each cut in the F-Gas phase down and don't use higher GWP refrigerants in new equipment.
- 8 Don't forget Energy Efficiency will be very important to achieve carbon neutral and zero net emissions.
- 9 Refrigerants are ready now for the future, that are a very low GWP and long-term sustainable solution.
- 10 There are lots of tools, guides and information available to support you with using A2Ls and we are all on hand to help with any questions or advice.
